

Data-source SSU of each admitted request: simultaneous arrivals can align all 32 queue fronts

SSU 0 SSU 1 SSU 2 SSU 3 SSU 4 SSU 5 SSU 6 SSU 7 No admitted request

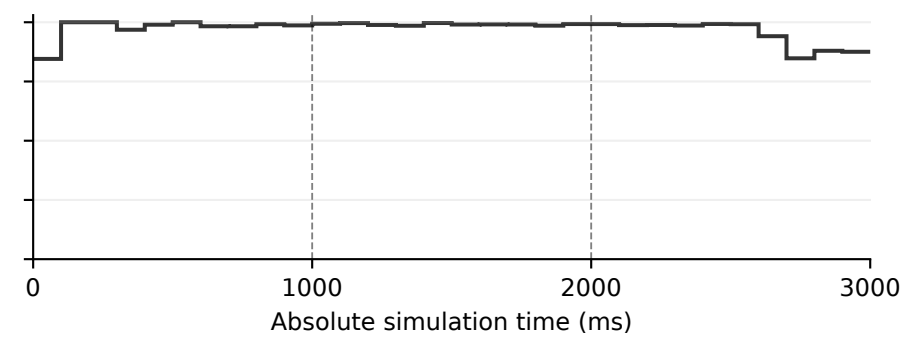

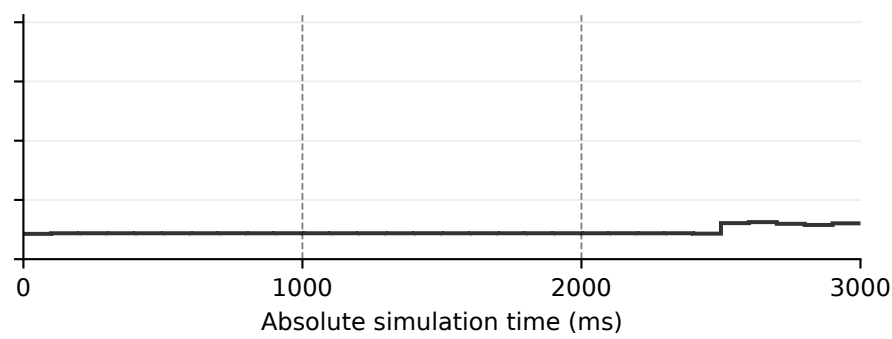

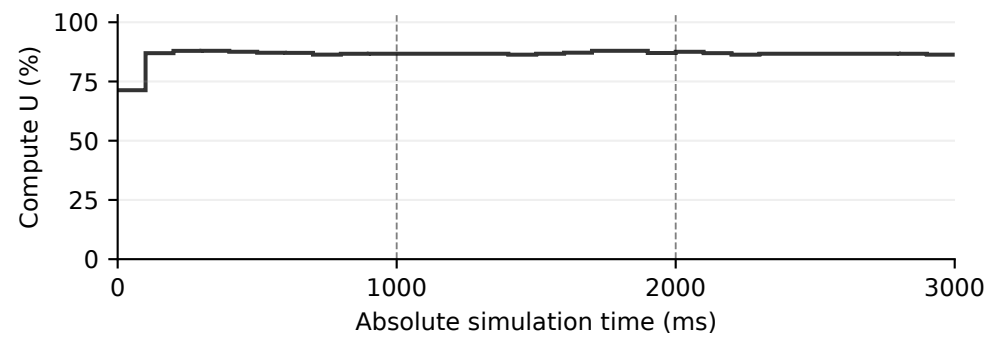

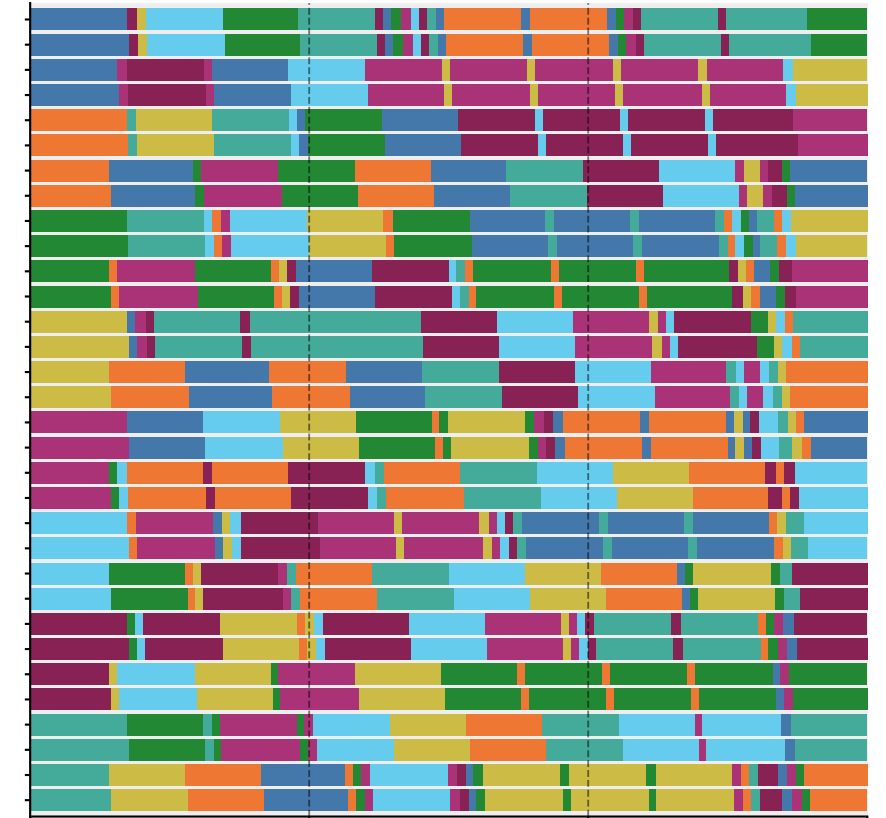

Baseline | original t = 0 input

B (deadline + fluid) | original t = 0

B (deadline + fluid) | interleaved

Colored spans are request admission-to-completion, including computation and waiting; they are not SSD activity. Lower plots recompute each real 100 ms window.

Only arrival fields change: rank(generation, original NPU) x 1 ns, maximum 2.735 us. C, V, SSD placement, request IDs and original NPU binding are preserved.
